The epsilon-Greedy algorithm is one of the easiest bandit algorithms to understand because it tries to be fair to the two opposite goals of exploration and exploitation by using a mechanism that even a little kid could understand: it just flips a coin.

With the help of a relevant user data stream, multi-armed bandits can become context-based.

Contextual bandit algorithms rely on an incoming stream of user context data, either historical or fresh, which can be used to make better algorithmic decisions in real-time.
