This is a concise and quick reference guide, clinically oriented, based on experience underpinned by published research data. The systems-based approach emphasizes the problem list process utilized by most practitioners when faced with a patient presenting with a single or variety of clinical symptoms. This allows generation of a complete list of infectious disease differentials, and the ability to include or exclude those indicated based on patient risk assessment. Pathogen specific information enables rational choice of diagnostics, therapy, and prognostication for a complete list of

This completely new manual describes diseases of dogs and cats caused by bacteria, fungi and viruses, as well as protozoans and other parasites. Aimed primarily at UK vets in general practice, the book concentrates on common conditions such as cat 'flu, infectious diarrhoea and pyoderma. It also includes detailed information on a number of important diseases that may be seen in animals imported into the UK. Several infectious diseases that might be seen in quarantined animals are covered but in less depth. Important non-infectious differential diagnoses are noted in the text where appropriate. A problem-oriented rather than a 'pattern recognition' approach

has been adopted. Infections are grouped together by affected body systems rather than by taxonomic classification. Thus, all gastrointestinal viruses, bacteria and parasites are considered in one chapter. When an infectious agent has more than one presentation (e.g. canine distemper virus) then one chapter contains the main details of clinical signs, diagnosis, treatment and control. Other chapters contain relevant details of clinical signs for the system but the reader is cross-referred to the main chapter for other information. Although the Manual does not provide details of microbial structure, replication, molecular biology and post-mortem findings that are not directly important to the practitioner, modern diagnostic techniques using molecular biology are described.
