The Diagnostic and Statistical Manual of Mental Disorders, Fifth Edition, Text Revision (DSM-5-TR), is the most comprehensive, current, and critical resource for clinical practice available to today's mental health clinicians and researchers. DSM-5-TR includes the fully revised text and references, updated diagnostic criteria and ICD-10-CM codes since DSM-5 was published in 2013. It features a new disorder, Prolonged Grief Disorder, as well as codes for suicidal behavior available to all clinicians of any discipline without the requirement of any other diagnosis. With contributions from over 200 subject matter experts, this updated volume boasts the most current text updates based on the scientific literature. Now in four-color and with the ability to authenticate each printed copy, DSM-5-TR provides a cohesive, updated presentation of criteria, diagnostic codes, and text. This latest volume offers a common language for clinicians involved in the diagnosis and study of mental disorders and facilitates an objective assessment of symptom presentations across a variety of clinical settings--inpatient, outpatient, partial hospital, consultation-liaison, clinical, private practice, and primary care. Stay current with these important updates in DSM-5-TR: Fully revised text for each disorder with updated sections on associated features, prevalence, development and course, risk and prognostic factors, culture, diagnostic markers, suicide, differential diagnosis, and more. Addition of Prolonged Grief Disorder (PGD) to Section II--a new disorder for diagnosis Over 70 modified criteria sets with helpful clarifications since publication of DSM-5 Fully updated Introduction and Use of the Manual to guide usage and provide context for important terminology Considerations of the impact of racism and discrimination on mental disorders integrated into the text New codes to flag and monitor suicidal behavior, available to all clinicians of any discipline and without the requirement of any other diagnosis Fully updated ICD-10-CM codes implemented since 2013, including over 50 coding updates new to DSM-5-TR for substance intoxication and withdrawal and other disorders Updated and redesigned Diagnostic Classification This manual is a valuable resource for other physicians and health professionals, including psychologists, counselors, nurses, and occupational and rehabilitation therapists, as well as social workers and forensic and legal specialists. The new DSM-5-TR is the most definitive resource for the diagnosis and classification of mental disorders.

Bipolar disorder is often misdiagnosed as depression in women or schizophrenia in men. This essential volume objectively and thoughtfully explores bipolar disorder. It provides a detailed description of the disorder and how it affects the body, as well as diagnosis and treatment. Readers will also

hear from personal stories of what it is like to live with this disorder.

The revolution in psychiatry that began in earnest in the 1960s led to dramatic advances in the understanding and treatment of manic-depressive illness. Hailed as the most outstanding book in the biomedical sciences when it was originally published in 1990, *Manic-Depressive Illness* was the first to survey this massive body of evidence comprehensively and to assess its meaning for both clinician and scientist. It also vividly portrayed the experience of manic-depressive illness from the perspective of patients, their doctors, and researchers. Encompassing an understanding about the illness as Kraepelin conceived of it—about its cyclical course and about the essential unity of its bipolar and recurrent unipolar forms—the book has become the definitive work on the topic, revered by both specialists and nonspecialists alike. Now, in this magnificent second edition, Drs. Frederick Goodwin and Kay Redfield Jamison bring their unique contribution to mental health science into the 21st century. In collaboration with a team of other leading scientists, a collaboration designed to preserve the unified voice of the two authors, they exhaustively review the biological and genetic literature that has dominated the field in recent years and incorporate cutting-edge research conducted since publication of the first edition. They also update their surveys of psychological and epidemiological evidence, as well as that pertaining to diagnostic issues, course, and outcome, and they offer practical guidelines for differential diagnosis and clinical management. The medical treatment of manic and depressive episodes is described, strategies for preventing future episodes are given in detail, and psychotherapeutic issues common in this illness are considered. Special emphasis is given to fostering compliance with medication regimens and treating patients who abuse drugs and alcohol or who pose a risk of suicide. This book, unique in the way that it retains the distinct perspective of its authors while assuring the maximum in-depth coverage of a vastly expanded base of scientific knowledge, will be a valuable and necessary addition to the libraries of psychiatrists and other physicians, psychologists, clinical social workers, neuroscientists, pharmacologists, and the patients and families who live with manic-depressive illness.

The book provides treatment recommendations for bipolar patients, a review of evidence about bipolar disorder, and states research needs
