plug to be ideally located within the combustion chamber for optimal flame propagation. Multi-valve engines tend to have smaller valves that have lower reciprocating mass, which can reduce wear on each cam lobe, and allow more power from higher RPM without the danger of valve bounce. Some engines are designed

In 1947, an American engineer named Ralph Miller patented an ingenious variation of the original Atkinson cycle. Rather than varying the actual length of the intake stroke, he realized that you could simply delay closing the intake valve past the end of the intake stroke. Then, as the piston traveled back up the
