resistance to crack growth which are not shared by plain concrete. The strength of concrete at first crack is appreciably increased by the crack arresting mechanism, of the fibres and the ultimate strength is also substantially increased because extra energy is needed to sense fracture of the fibres reinforcing the

Reinforced cement concrete: Since concrete is a brittle material and is strong in compression. It is weak in tension, so steel is used inside concrete for strengthening and reinforcing the tensile strength of concrete. The steel must have appropriate deformations to provide strong bonds and interlocking of both

Rebar is central to reinforced concrete, so a basic understanding helps. The various sizes are important to know: a #3 bar is $3/8$ " in diameter, a #7 bar is $7/8$ " in diameter, etc. The easy rule of thumb for rebar sizes is to take the rebar size and
