IPC Users Guide. Inter-Processor Communication (IPC) provides a processor-agnostic API which can be used for communication between processors in a multi-processor environment (inter-core), communication to other threads on same processor (inter-process), and communication to peripherals (inter-device). The API supports message passing, streams, and linked lists.

IPC Users Guide—Texas Instruments Wiki

IPC is a component containing packages that are designed to allow communication between processors in a multi-processor environment and communication to peripherals. This communication includes message passing, streams, and linked lists. These work transparently in both uni-processor and multi- processor configurations.

SYS/BIOS Inter-Processor Communication (IPC)-1-25 (Rev. E)

The IPC product contains an examples/archive directory with device-specific examples. Once identifying your device, the examples can be unzipped anywhere on your build host. Typically once unzipped, the user edits the example's individual products.mak file and simply invokes make.

The ti.sdo.ipc.Notify module manages the multiplexing/demultiplexing of software interrupts over hardware interrupts. In order to use any Notify APIs, you must first call ipc_start(). This sets up all the necessary Notify drivers, shared memory, and interprocessor interrupts.

IPC provides an implementation of the IMessageQT ransport interface called ti.sdo.ipc.transports.TransportShm (shared memory). You can write other implementations to meet your needs. When a transport is created via a transport-specific create() call, a remote processor ID (defined via the MultiProc module) is specified.
